METHOD AND APPARATUS FOR MANAGING MEMORY IN A WORKSTATION

ABSTRACT OF THE DISCLOSURE

A workstation including a memory management scheme is disclosed herein. The memory management scheme permits a large number of files to be open on the workstation. The memory management scheme includes a prioritization scheme such that the least relevant files are unloaded from the workstation memory when space is needed to download newly opened files. The memory management scheme further includes saving settings of files unloaded from the workstation memory so that they can be reloaded when needed, with a user perceiving the unloaded files as being continually open.
